

If you are on a Windows machine and get an error message saying something along the lines of:

conda : The term 'conda' is not recognized as the name of a cmdlet

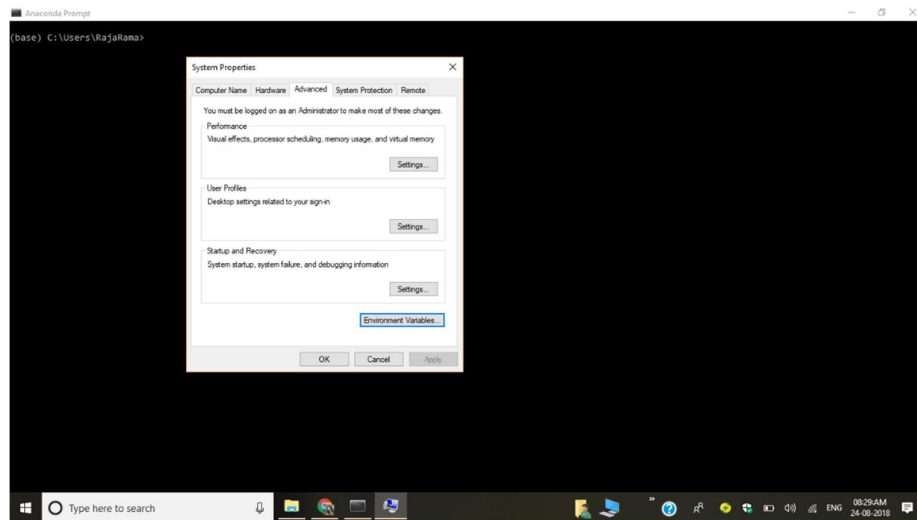

The solution (hopefully) is to add Conda to your path/environment variables.

Follow this guide:

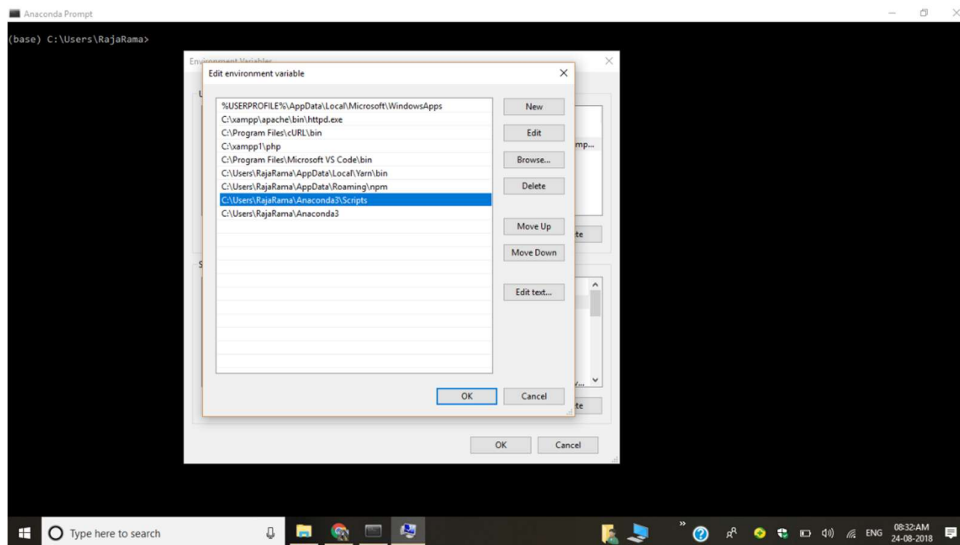

- 1) Press the Windows-button and search for “edit the system environment variables”

2) Press the “Environment Variables” button:

- 3) Open anaconda-prompt. Type “where conda”. This will give you the location of anaconda on your pc.
- 4) On three empty lines of the path variables, click “edit” and add the following (where the path is replaced by the location you found in step 3):
 - a. C:\...\Anaconda3\Scripts
 - b. C:\...\Anaconda3
 - c. C:\...\Anaconda3\Library\bin

5) Restart your computer :)
